SIR 5 COORDINATED TRANSACTION SCHEDULING (SPP)

- **Purpose:**

- The objective of CTS is to coordinate with a neighboring ISO/RTO through a market based solution that allows market participants bid to buy power at the proxy bus in one area and offer to sell at the proxy bus in the other area
- CTS would allow Market Participants to submit bids and offers that will be inputs to the market clearing engine influencing the scheduling of power from one ISO/RTO to the other ISO/RTO rather than trying to predicting when an arbitrage opportunity exists

- **Potential Benefit:**

- Market-to-Market currently optimizes the SPP-MISO seam when there is congestion , but Coordinated Transaction Scheduling (CTS) provides a market mechanism to better align SPP's interchange scheduling with MISO through economics when there is not active congestion
- Implementing CTS would lead to enhanced Net Scheduled Interchange (NSI) predictability, enhanced price convergence between SPP and MISO, and lower production costs in both SPP and MISO

SIR5 COORDINATED TRANSACTION SCHEDULING (SPP)

- **Potential System / Process Impacts**

- API/MUI, Day-Ahead Market, Market-2-Market, Market Clearing Engine Performance, MOI, Unit Commitment, Scheduling, Settlements, Real-Time Market

- **Potential MCE Performance Impact**

- Low

- **Potential Complexity**

- Design: High
- Implementation: High

SIR5 COORDINATED TRANSACTION SCHEDULING (SPP)

- **Potential Risk**

- Requires full participation from MISO to implement
- Arbitrage opportunities between each RTO could lessen over time if properly implemented

- **Market Philosophy Impacts:**

- Price Formation, Price Convergence, Market Efficiency

SIR5 COORDINATED TRANSACTION SCHEDULING (SPP)

- **SPP MMU Comments**

- As part of a joint study with Potomac Economics on seams issues for the Regional State Committee / Organization of MISO States (RSC/OMS) joint liaison committee, the SPP MMU is currently studying potential market efficiencies that could be gained through coordinated transaction scheduling with the MISO region.
- The MMU supports a study of market impacts and potential market efficiency gains through a coordinated transaction scheduling product.
- MMU support of implementation of coordinated transaction scheduling will be determined by the outcome of the study.
- MMU support of a coordinated transaction scheduling design will be determined by the design elements proposed.
- The MMU would like to participate with the RTO in a study of coordinated transaction scheduling between SPP and MISO, as well as any study supported design effort.
